

Vaccines

At school, in England, I was taught that this great breakthrough in public health was due to the efforts of one Dr. Edward Jenner which merely goes to show how politically motivated the school curriculum was even then. If you tootle over to Wikipedia, you will see that an almost identical technique was definitely in use 800 years earlier amongst the "ignorant" Arabs.

The theory of vaccination against parasitic germs is based upon finding a weak form of the same virus (in Dr. Jenner's case, the cow pox virus) and injecting this into humans. Humans almost always overcame the cow pox with no difficulty with the advantage that the antibodies which they developed against the cow pox virus are also effective against the much more virulent small pox virus.

So much for medical theory. The questions, however, which remain unaddressed are:

- A) What are the environmental and emotional factors which rendered someone susceptible to small pox infection?
- B) What enabled the majority of the population (not just the milk maids) to be immune?
- C) W.H.O. figures from the early 1950's (oh boy would I love to have some earlier numbers) show that, at that time, 1.11% of the world's population was infected. What are the factors determining that 98.89% of people were "naturally immune"?
- D) What purpose did the small pox virus serve and what, if anything, has taken its place?

Just let me put this in a more mundane context for you.

It is a curious but little known fact that many people will actually drive more skilfully with a small amount of alcohol than completely sober. Following the reasoning of medical theory, it should, therefore, be compulsory to take a small shot of whisky before setting off to drive.

Now, most of us know that this is stupid nonsense because it ignores all the other relevant factors.

Most of us know, from personal experience, that the same amount of alcohol will have very different effects under different circumstances. A glass of wine with dinner at the end of a very hectic day's work can both relax us and make us more focussed upon what we're actually doing rather than re-living the day's events. The same glass of wine in a state of near exhaustion and upon an empty stomach can even make it difficult to stand up let alone drive a car. As Sherlock Holmes was wont to say, "Never judge from a single fact" and "Only an explanation which includes ALL the facts can be correct."

The facts of the matter are that we have not the vaguest idea what the other factors relevant to small pox are.

Why do I pick on small pox? Because this is the one and only illness with which vaccination appears to have achieved anything positive.

This one example has been ruthlessly abused over the last half century to justify a vast plethora of vaccinations DESPITE the absence of any evidence that they achieve anything useful! To the contrary, available evidence from World Health Organisation studies clearly shows that vaccination is a major factor not in the reduction but the SPREADING of many illnesses.

The theory of vaccination for which Dr. Jenner is widely acclaimed, requires that the injected low potency virus be so similar to the "dangerous" one that the same antibody will do for both. Small pox/cow pox is the only time in history that this has worked. There is no evidence to show that any other vaccination programme has achieved anything useful. There are a lot of

manufactured figures which look convincing until you add the "deselected facts" back in and see that your government has been wasting your money. Just to show you how close a fit a virus and a vaccine have to have, just trying walking around your city and see how many doors you can open with your house key.

In a city the size of New York or London, there are, theoretically, 5 apartments which could be opened with the same key. (Estimates from lock manufacturers.) Finding a needle in a haystack is child's play compared to finding those other four doors. Finding a needle in a haystack should not take you more than a week. Finding those other five doors is something which you may begin but only your child or grandchild could complete. As buildings are constantly being torn down and rebuilt, the task is, actually, impossible. You might, by chance, find one door if it were in your street, as Dr. Jenner did but it is ridiculous to suppose that you could repeat this.

Viruses and antibodies are much, much, much more complex than door locks and keys. Finding another such close fit as cow pox and small pox is about as likely as a golden meteorite landing by parachute in your garden. The pharmaceutical conglomerate would have you believe, however, that this is something which they achieve on a regular basis. It's a free world (at the moment anyway), you can choose to believe their nonsense if you like but it still doesn't make it true.

Swine 'Flu is so widespread across the planet and has been for so many thousands of years that it is probable that a very large proportion of humanity has both the virus and the anti-body in their body right now.

How you can make your own personal vaccine at home **in 5 minutes.**

This is a little known technique based upon homeopathic principles and natural resonance. You see, your own urine mirrors exactly all the processes

which are currently going on in your body. This includes very specific information about infections and the state of progress in eliminating them. By adding this information back into the system, one causes the entire system to become focussed upon that which is most urgent right now. So, for example, if your urine shows that you have an unfortunate quantity of swine 'flu viruses active in your system, feeding this information back in will focus your immune system upon the production of anti-bodies for that virus. Anti-body production will rapidly rise within 20 minutes and a fever can be eliminated within hours.

This is how to do it:

Take a small amount of your own urine, mid stream. Add two drops of this to one tablespoonful of water in a dropper bottle. Shake the bottle fifty times. Now it's ready to use! You can add a little brandy if you like but, if you make this fresh every day, as you should, then no preserving alcohol is necessary.

Dosage:

Four drops under your tongue every two hours. This will naturally focus your natural immunity upon that which is presenting you with the biggest problem at that time. This is why it is wisest to make the vaccine fresh every day.
